

Market Review

Wintery Mix Hits Markets in January

Changing interest rate expectations impact markets at the start of the year

January 2024

Key Observations

- Markets were mixed in January, with U.S. large cap equities leading the way while non-U.S. equities and fixed income produced lackluster returns.
- Market sentiment shifted and optimism on the potential for a soft-landing grew. Expectations for a Federal Reserve rate cut early in 2024 shifted significantly over the course of the month.
- Economic data has delivered above expectations of late, but potential headwinds remain and preparing for rather than predicting a downturn, we believe, is the prudent approach.

Financial Market Performance		
Index	January	YTD
S&P 500	1.7%	1.7%
Russell 2000	-3.9%	-3.9%
MSCI EAFE	0.6%	0.6%
MSCI EM	-4.6%	-4.6%
Bloomberg U.S. Agg Bond	-0.3%	-0.3%

Market Recap

The New Year began with mixed results across asset classes. Growing optimism around the potential for a soft-landing, expectations on central bank policy, and turmoil in the Red Sea all had an impact on returns. Large cap domestic equities were the winner in January, with the S&P 500 returning 1.7%. The “Magnificent 7” once again helped push the top-heavy S&P 500 Index higher, accounting for over 20% of the return for the month¹ and exacerbated the dispersion between the S&P 500’s equal weighted sibling (see chart on pg 2.). Small cap stocks struggled, with negative returns across almost every sector within the index. Despite the tailwind of more favorable economic conditions, the shift in interest rate expectations was the main drag on the small cap space as investors lowered their outlook for the first rate cut to happen in March.

Abroad, both developed and emerging market equity markets struggled. The U.S. economy continues to grow while neighbors across the pond remain flat. Growth in the European Union was flat in the fourth quarter of 2023, resulting in 0.5% growth for calendar year 2023 across the EU, according to the “first estimate”.² The developed market focused MSCI EAFE Index gained a modest 0.6% in the first month of the year. In addition to lackluster economic growth, ongoing conflict between Ukraine and Russia and rising tensions in the Middle East and the Red Sea weighed on investor sentiment. Emerging markets, as measured by the MSCI EM Index, returned -4.6%. China, which accounts for over 25% of the benchmark³, continues to be a primary detractor with the country declining 10.6% in January. Anemic economic conditions along with the continued struggle for a debt laden property sector have weighed on investor sentiment. The Chinese government though has not sat idle and has continued to ease lending standards and begun stimulus measures to support economic growth in hopes of restoring animal spirits in markets.

Bond markets took a step back from the strong rally seen in the fourth quarter of 2023, with the Bloomberg U.S. Aggregate Index falling 0.3%. Growing optimism for a soft-landing, shifting expectations for a March interest rate cut, and the heavy issuance calendar of longer dated paper drove the repricing in the fixed income market. The corporate high yield market was flat in the month. The sector is less-interest rate sensitive than the broader market (i.e., lower duration) and spreads ultimately ended the quarter close to where they began.

Diversifying areas of the market such as commodities and REITs struggled as well. The Bloomberg Commodity Index produced a slight positive return (+0.4%). Falling precious metal prices, particularly gold, was a headwind. However higher energy prices helped buoy the asset class as conflict in the Red Sea grew and oil prices rose. REITs traded down on the shift in expectations for rate cuts later in the year after having returned over 16% in Q4 2023 as rate expectations fell. Lower rates reduce lending costs for properties owners, which would be a welcome sign of relief for a market historically reliant on higher levels of debt.

Investor Optimism Growing but Should Still Be Cautious

Investor optimism surrounding a soft-landing grew in January. Consumer confidence saw a large jump in the month and now sits at the highest level in the last two years. Not surprisingly, this has coincided with relatively resilient economic data and positive market returns. The U.S. economy showed continued growth in the fourth quarter 2023 as the “advance GDP” estimate reported 3.3%; a strong number, but a sharp drop from the almost 5% growth in the third quarter of last year.⁴

U.S. Consumer Confidence Index

Much of the growth was due to an increase in consumer spending. Inflation, which has been at or near the top of key metrics investors have been watching, continues to moderate. The broadest measure of inflation, U.S. Consumer Price Index (CPI), has trended significantly lower since the start of 2023 and now sits at 3.4% as of December 2023, the most recent reading. While still hovering above the Fed’s 2% target, if we remove the shelter component, which has been persistently high over the past two years, inflation has been at or below 2% since June 2023.⁵

Heading into the end of 2023, investor expectations were widely bullish on a Federal Reserve rate cut in March 2024. However, the resilience of the U.S. economy and favorable data being reported in recent weeks has seen those expectations shift significantly. While moderating inflation has set the stage for potential cuts in the future, the strong economy has softened the expectation. Markets were pricing an over 80% probability of a Fed cut in March as of the end of 2023, and that shifted to just a 40% probability at the end of January. This shift in expectations had a large impact on markets in the month, as discussed above.

Market Implied Probability of Fed Rate Cut at March 2024 Meeting

Source: CME FedWatch Tool as of January 31,

S&P 500 have issued earnings guidance for Q1, over half have been negative.⁶ As we highlighted in our 2024 outlook, [Prepare Not Predict](#), we remain grounded and recognize that economic contractions are a normal course of the market cycle. The market is pricing in a greater than 50% chance that the Fed’s target rate will be over 100 bps lower than the current level by year-end⁷, implying investors do in fact see the need for potential central bank action to help support the economy.

Outlook

Our investment themes that we outlined heading into 2024 remain in the wake of mixed market performance in January: the “messy middle” inflation range of 2-5%, preparing not predicting recession, and concentrated consequences. The path for interest rates, in our view, is ultimately lower, and coupled with the potential for an economic slowdown in the future supports higher quality duration assets. The pronounced continued outperformance and concentration in U.S. large cap has created imbalances and presents opportunities in other asset classes and backs our belief in constructing long-term oriented diversified portfolios.

Economic data has certainly been better than expectations in recent months, but it does not mean we are in the clear and have avoided a recession all together. Signals, such as negative leading indicators, still restrictive central bank policy and unemployment, while still low, has moved above its 12-month moving average. Additionally, we are seeing signs from the corporate sector that the outlook may not be all rosy. While only a limited number of companies in the
